5-megapixel medical monitor

Mammography is increasingly being used in combination with ultrasound for breast cancer screenings on patients with high breast density. More in-depth checks include biopsies as well as breast MRIs and CTs. This range of options requires colour monitors for image reproduction. The RadiForce RX560 is the world's first medical colour monitor that uses an LCD on an LTPS (lowtemperature polysilicon) basis. This is why it fulfills the brightness requirements applicable for mammograms, which are usually only achieved by greyscale monitors. This monitor achieves a brightness of up to 1100 cd/m². It reproduces top-quality images from the various types of diagnostic methods. Its high contrast ratio of 1500:1 is close to that of a monochrome monitor. Moreover, it displays deep black tones without a 'washed-out' effect.

- Two 5-megapixel colour LCD screens with consistently high and stable brightness for clear mammogram imaging
- Clear perceptibility of microstructures through high contrast and Sharpness Recovery technology
- Palette with 543 billion hues for precise colour reproduction (10-bit resolution max.)
- Hybrid gamma PXL functionality for precise display, down to the pixel, of greyscale and colour images with the required luminance characteristic curve

- Homogenous display surface with automatic luminance distribution control (Digital Uniformity Equalizer)
- Set up for calibration, acceptance, and consistency testing in accordance with DIN 6868-157 and QS-RL
- Substrate the sensor of the se
- Light sensor to measure ambient light at the diagnostic station
- Compact dual-screen solution through a shared stand with narrow bezels and ergonomic design
